

# ACC: Extend context menus with more links to configuration

## 1.0

### Summary

The Monitoring section of the UI does not have direct links to configuration of items, triggers and other objects. Users are forced to go to the host configuration form, which currently is a modal windows and also has no ability to navigate to related objects. It must be fixed.

### Use cases

1. I want to have direct navigation to host related objects from host context menu
2. I want to have direct navigation to item triggers from item context menu
3. I want to have direct navigation to configuration of items from event and trigger context menus

### Zabbix acceptance

1. Host context menu must be extended to contain links to configuration of host items, triggers, discovery rules and web monitoring
2. Item context menu must be extended to contain links to configuration of item triggers and trigger creation form
3. Event and trigger context menus must be extended to contain links to item configuration forms
4. The menu invocable by clicking on "..." in the list of items must be replaced by the Item context menu
5. The configuration part of the context menus must not be visible if no permissions

### Zabbix UI changes

Layout of the menus must match the following mockups:

VIEW Dashboards Problems Latest data Graphs Web Inventory	VIEW <b>Latest data</b> Graph Values 500 latest values	VIEW <b>Problems</b> /: Used space /: Space utilization /: Total space
CONFIGURATION Host Items Triggers Discovery Web	CONFIGURATION Item Triggers ▶ Create trigger Create dependent item Create dependent discovery rule	CONFIGURATION Trigger Items ▶
SCRIPTS Execute ▶ Detect operating system Ping ▶ Traceroute	ACTIONS Execute now	LINKS Trigger URL
		SCRIPTS Script 1 Script 2
